

ABSTRACT

PROCESS

- 5 A process for etching a metal or alloy surface which comprises applying an etch-resist ink by ink jet printing to selected areas of the metal or alloy, solidifying the etch-resist ink without the use of actinic light and / or particle beam radiation and then removing the exposed metal or alloy by a chemical etching process wherein the etch-resist ink comprises the components:
- 10 A) 60 to 100 parts carrier vehicle comprising one or more components which contain at least one metal chelating group;
- D) 0 to 40 parts colorant; and
- E) 0 to 5 parts surfactant;
- wherein the ink has a viscosity of not greater than 30 cPs (mPa.s) at the firing
- 15 temperature, all parts are by weight and the total number of parts A)+B)+C) = 100.
